A CRM APPLICATION FOR THE CHAISHOP & CO

USE STORY

As a sales employee,

I want to add new customer details,

so that customer information can be stored and managed easily.

Details:

Customer Name

Phone Number

Email

Address

Company Name

Customer Type

User Story 2 - Manage Customers

As an admin,

I want to view, edit, and delete customer details,

so that customer records remain accurate and updated.

User Story 3 - Lead Management

As a sales employee,

I want to create and track leads,

so that potential customers can be converted into actual customers.

User Story 4 - Follow-up Management

As a sales employee,

I want to schedule customer follow-ups,

so that I don't miss important customer interactions.

User Story 5 - Sales Management

As a sales employee,

I want to record sales and order details,

so that I can track customer purchases.

User Story 6 - Reports

As an admin,

I want to generate customer and sales reports,

so that I can understand business performance.

User Story 7 - Login & Security

As a user,

I want to securely log in to the CRM system,

so that only authorized users can access customer information.

CRM Application Project - Purpose

The purpose of a CRM (Customer Relationship Management) application is to manage customer information and improve the relationship between a business and its customers.

Main purposes:

Store and manage customer details.

Track customer interactions and enquiries.

Manage sales and customer follow-ups.

Improve customer service.

Reduce manual paperwork and save time.

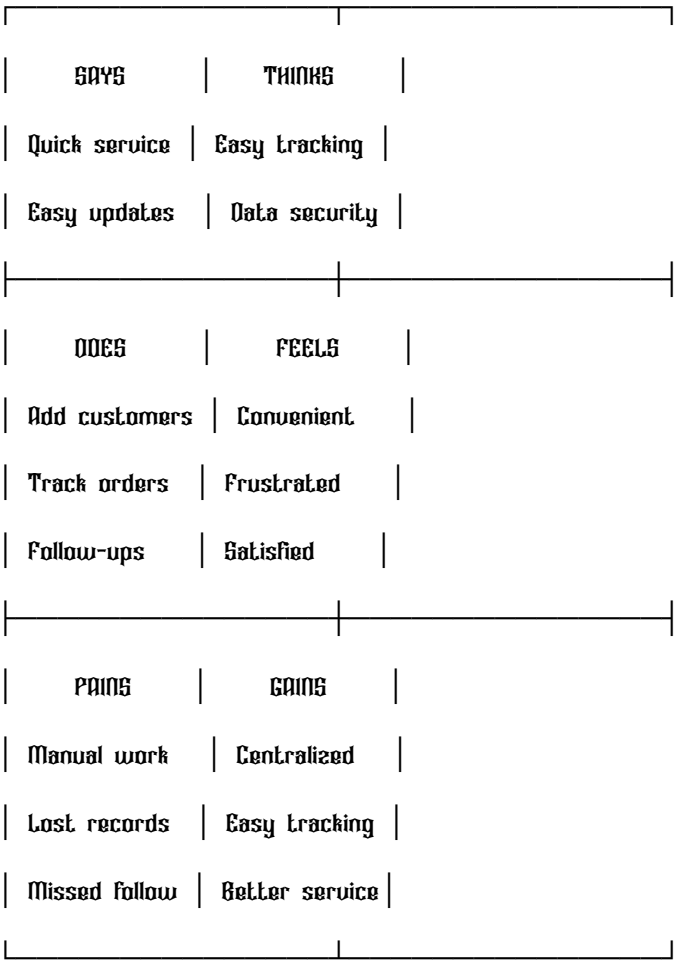

Generate reports for business analysis.

Help the company maintain long-term customer relationships.

Project Title: CRM Application for Thechaiahop & Co.

💡 Brainstorming Ideas

Customer Management

Add customer details

Edit and delete customer information

View customer history

Lead Management

Add new leads

Track lead status

Convert leads into customers

Sales Management

Record sales

Track orders

View sales history

Communication

Send email/SMS notifications

Record customer conversations

Follow-up reminders

Complaint Management

Register customer complaints

Track complaint status

Update resolution details

Dashboard

Total customers

New leads

Completed sales

Pending follow-ups

Reports

Customer reports

Sales reports

Lead reports

Complaint reports

Requirement Analysis is the first major phase of the CRM application project. It identifies what the system should do and what users need.

1. Functional Requirements

User registration and login

Customer details management

Add, update, delete and search customers

Manage customer enquiries and complaints

Track sales and customer interactions

Schedule follow-up activities

Manage employee/user details

Generate customer and sales reports

Admin dashboard

2. Non-Functional Requirements

Security: User authentication and data protection

Performance: Quick response to user requests

Usability: Simple and user-friendly interface

Reliability: System should work consistently

Scalability: Can support more customers and users

Availability: System should be accessible when required

3. User Requirements

Admin: Manage users, customers, reports and system settings.

Employee: Add customers, update interactions, manage follow-ups and enquiries.

Customer: Provide details, enquiries and feedback.

4. Hardware Requirements

Computer/mobile device

Minimum 4 GB RAM

Internet connection

Server/database system

5. Software Requirements

Front-end: HTML, CSS, JavaScript

Back-end: ASP.NET / PHP / Java

Database: MySQL / SQL Server

Operating System: Windows/Linux

6. Requirement Analysis Outcome

The final outcome of this phase is a Software Requirement Specification (SRS) containing all functional, non-functional, user, hardware and software requirements of the CRM application.

Example:

A CRM application helps a company manage its customers, sales, communication, and service requests in one system.

Main Modules:

Admin Login – Manage the CRM system.

Customer Management – Add, edit, delete and view customer details.

Sales Management – Track products, orders and sales.

Lead Management – Manage new customer leads and follow-ups.

Communication – Record calls, emails and customer interactions.

Service/Complaint Management – Track customer complaints and solutions.

Reports & Dashboard – View sales, customers, leads and performance reports.

CRM Application Project – Performance

The CRM (Customer Relationship Management) application improves business performance by managing customer information, sales, communication, and service activities in one system.

Key performance points:

Faster customer management – Customer details can be accessed quickly.

Improved sales – Helps track leads, opportunities, and sales activities.

Better customer service – Customer complaints and requests can be monitored.

Time saving – Reduces manual data entry and paperwork.

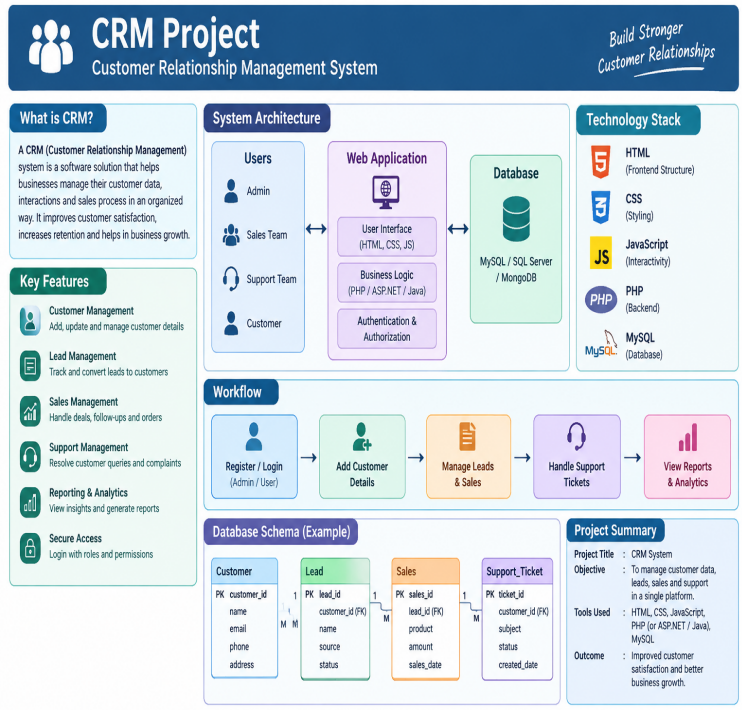

Accurate reports - Generates useful sales and customer reports.

Better productivity - Employees can manage tasks and follow-ups efficiently.

Customer retention - Regular follow-ups help maintain customer relationships.

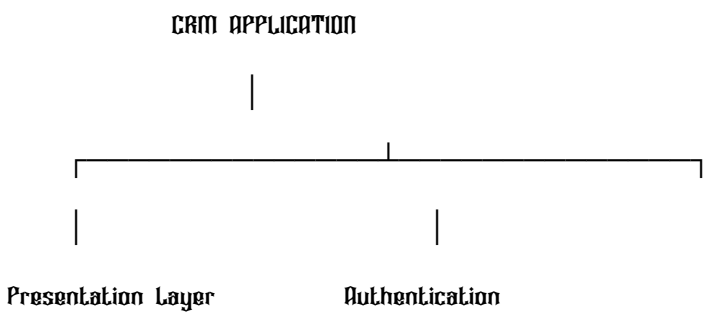

Data security - Customer information can be stored and managed securely
